2013 ACC/AHA Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults

Endorsed by the American Association of Cardiovascular and Pulmonary Rehabilitation, American Pharmacists Association, American Society for Preventive Cardiology, Association of Black Cardiologists, Preventive Cardiovascular Nurses Association, and WomenHeart: The National Coalition for Women with Heart Disease
Citation

This slide set is adapted from the 2013 ACC/AHA Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults. E-Published on November 12, 2013, available at:

ACC/AHA Blood Cholesterol Guideline

Panel Members

Neil J. Stone, MD, MACP, FAHA, FACC, Chair
Jennifer G. Robinson, MD, MPH, FAHA, Vice Chair
Alice H. Lichtenstein, DSc, FAHA, Vice Chair

Anne C. Goldberg, MD, FACP, FAHA
Conrad B. Blum, MD, FAHA
Robert H. Eckel, MD, FAHA, FACC
Daniel Levy, MD*
David Gordon, MD*
C. Noel Bairey Merz, MD, FAHA, FACC

Donald M. Lloyd-Jones, MD, ScM, FACC, FAHA
J. Sanford Schwartz, MD
Patrick McBride, MD, MPH, FAHA
Sidney C. Smith, Jr, MD, FACC, FAHA
Karol Watson, MD, PhD, FACC, FAHA
Susan T. Shero, MS, RN*
Peter W.F. Wilson, MD, FAHA

Conflict of Interest/Relationships With Industry

1) All panel members disclosed conflict of interest information to the full panel in advance of the deliberations

2) Members with conflicts recused themselves from voting on any aspect of the guideline where a conflict might exist

3) All 16 members of the NHLBI ATP IV Panel transitioned to the ACC/AHA guideline Expert Panel

4) Independent contractors performed the systematic review with the assistance of the Expert Panel and provided methodological guidance to the Expert Panel
NHLBI Charge to the Expert Panel

Evaluate higher quality randomized controlled trial (RCT) evidence for cholesterol-lowering drug therapy to reduce ASCVD risk

- Use Critical Questions (CQs) to create the evidence search from which the guideline is developed
  - Cholesterol Panel: 3 CQs
  - Risk Assessment Work Group: 2 CQs
  - Lifestyle Management Work Group: 3 CQs

- RCTs and systematic reviews/meta-analyses of RCTs independently assessed as fair-to-good quality

- Develop recommendations based on RCT evidence
Systematic Review Process

• The Expert Panel constructed CQs relevant to clinical practice.
• The Expert Panel identified (a priori) inclusion/exclusion (I/E) criteria for each CQ.
• An independent contractor developed a literature search strategy, based on I/E criteria, for published clinical trial reports for each CQ.
• An independent contractor executed a systematic electronic search of the published literature from relevant bibliographic databases for each CQ.
• The date for the overall literature search was from January 1, 1995 through December 1, 2009.
• However, RCTs with the ASCVD outcomes of MI, stroke, and cardiovascular death published after that date were eligible for consideration until July 2013.
# NHLBI Grading the Strength of Recommendation

<table>
<thead>
<tr>
<th>Grade</th>
<th>Strength of Recommendation*</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td><strong>Strong recommendation:</strong> There is high certainty based on evidence that the net benefit is substantial.</td>
</tr>
<tr>
<td>B</td>
<td><strong>Moderate recommendation:</strong> There is moderate certainty based on evidence that the net benefit is moderate to substantial, or there is high certainty that the net benefit is moderate.</td>
</tr>
<tr>
<td>C</td>
<td><strong>Weak recommendation:</strong> There is at least moderate certainty based on evidence that there is a small net benefit.</td>
</tr>
<tr>
<td>D</td>
<td><strong>Recommendation against:</strong> There is at least moderate certainty based on evidence that it has no net benefit or that risks/harms outweigh benefits.</td>
</tr>
<tr>
<td>E</td>
<td><strong>Expert opinion (&quot;There is insufficient evidence or evidence is unclear or conflicting, but this is what the Panel recommends.&quot;)</strong> Net benefit is unclear. Balance of benefits and harms cannot be determined because of no evidence, insufficient evidence, unclear evidence, or conflicting evidence, but the Panel thought it was important to provide clinical guidance and make a recommendation. Further research is recommended in this area.</td>
</tr>
<tr>
<td>N</td>
<td><strong>No recommendation for or against (&quot;There is insufficient evidence or evidence is unclear or conflicting.&quot;)</strong> Net benefit is unclear. Balance of benefits and harms cannot be determined because of no evidence, insufficient evidence, unclear evidence, or conflicting evidence, and the Panel thought no recommendation should be made. Further research is recommended in this area.</td>
</tr>
</tbody>

A recommendation with Level of Evidence B or C does not imply that the recommendation is weak. Many important clinical questions addressed in the guidelines do not lend themselves to clinical trials. Although randomized trials are unavailable, there may be a very clear clinical consensus that a particular test or therapy is useful or effective.

*Data available from clinical trials or registries about the usefulness/efficacy in different subpopulations, such as sex, age, history of diabetes, history of prior myocardial infarction, history of heart failure, and prior aspirin use.

†For comparative effectiveness recommendations (Class I and IIa; Level of Evidence A and B only), studies that support the use of comparator verbs should involve direct comparisons of the treatments or strategies being evaluated.
4 Statin Benefit Groups

- Clinical ASCVD*
- LDL–C ≥190 mg/dL, Age ≥21 years
- Primary prevention - Diabetes: Age 40-75 years, LDL–C 70-189 mg/dL
- Primary prevention - No Diabetes**: ≥7.5%† 10-year ASCVD risk, Age 40-75 years, LDL–C 70-189 mg/dL

* Atherosclerotic cardiovascular disease
**Requires discussion between clinician and patient before statin initiation
† Statin therapy may also be considered in those with 5-<7.5% 10-year ASCVD risk or when a risk-based treatment decision is uncertain
**Vignettes: Putting a face on patients in whom ASCVD risk reduction works**

- 63 yo man with STEMI, discharged on a high-intensity statin
- 26 yo woman with elevated LDL–C of 220 mg/dL, noted in teens + family history CHD
- 44 yo woman with diabetes, well-controlled hypertension and micro-albuminuria
- 56 yo African-American woman with multiple ASCVD risk factors
- 57 yo white man with LDL-C 165 mg/dl
Guideline Scope

- Focus on treatment of blood cholesterol to reduce ASCVD risk in adults
- Emphasize adherence to a heart healthy lifestyle as foundation of ASCVD risk reduction
  - See Lifestyle Management Guideline
- Identify individuals most likely to benefit from cholesterol-lowering therapy
  - 4 statin benefit groups
- Identify safety issues
New Perspective on LDL–C & Non-HDL–C Goals

• Lack of RCT evidence to support titration of drug therapy to specific LDL–C and/or non-HDL–C goals
• Strong evidence that *appropriate intensity of statin therapy* should be used to reduce ASCVD risk in those most likely to benefit
• Quantitative comparison of statin benefits with statin risk
• Nonstatin therapies – did not provide ASCVD risk reduction benefits or safety profiles comparable to statin therapy
Why Not Continue to Treat to Target?

Major difficulties:

1. Current RCT data do not indicate what the target should be
2. Unknown magnitude of additional ASCVD risk reduction with one target compared to another
3. Unknown rate of additional adverse effects from multidrug therapy used to achieve a specific goal
4. Therefore, unknown net benefit from treat-to-target approach
4 Statin Benefit Groups

ASCVD Statin Benefit Groups
Heart healthy lifestyle habits are the foundation of ASCVD prevention. In individuals not receiving cholesterol-lowering drug therapy, recalculate estimated 10-y ASCVD risk every 4-6 y in individuals aged 40-75 y without clinical ASCVD or diabetes and with LDL–C 70-189 mg/dL.

Adults age ≥21 y and a candidate for statin therapy → Clinical ASCVD

- Yes
  - Age ≤75 y
    - High-intensity statin (Moderate-intensity statin if not candidate for high-intensity statin)
  - Yes
    - Age >75 y OR if not candidate for high-intensity statin
      - Moderate-intensity statin
  - No
    - LDL–C ≥190 mg/dL
      - Yes
        - High-intensity statin (Moderate-intensity statin if not candidate for high-intensity statin)
      - No
        - Diabetes
          - Type 1 or 2
            - Yes
              - Estimated 10-y ASCVD risk ≥7.5%*
                - High-intensity statin
            - No
              - Moderate-intensity statin

*Percent reduction in LDL–C can be used as an indication of response and adherence to therapy, but is not in itself a treatment goal.
4 Statin Benefit Groups (con’t)

‡Primary LDL–C ≥160 mg/dL or other evidence of genetic hyperlipidemias, family history of premature ASCVD with onset <55 years of age in a first degree male relative or <65 years of age in a first degree female relative, high-sensitivity C-reactive protein >2 mg/L, CAC score ≥300 Agatston units or ≥75 percentile for age, sex, and ethnicity, ankle-brachial index <0.9, or elevated lifetime risk of ASCVD.
Intensity of Statin Therapy

*Individual responses to statin therapy varied in the RCTs and should be expected to vary in clinical practice. There might be a biologic basis for a less-than-average response.
†Evidence from 1 RCT only: down-titration if unable to tolerate atorvastatin 80 mg in IDEAL (Pedersen et al).
‡Although simvastatin 80 mg was evaluated in RCTs, initiation of simvastatin 80 mg or titration to 80 mg is not recommended by the FDA due to the increased risk of myopathy, including rhabdomyolysis.
Clinical ASCVD
Initiating Statin therapy

Clinical ASCVD
Not currently on statin therapy
Initial evaluation prior to statin initiation
- Fasting lipid panel*
- ALT
- CK (if indicated)
- Consider evaluation for other secondary causes (Table 6) or conditions that may influence statin safety (Table 8, Rec 1).

Evaluate and Treat Laboratory Abnormalities
1. Triglycerides ≥500 mg/dL
2. LDL–C ≥190 mg/dL
   - Secondary causes (Table 6)
   - If primary, screen family for FH
3. Unexplained ALT >3X ULN

Aged ≤75 y
without contraindications, conditions or drug-drug interactions influencing statin safety, or a history of statin intolerance
- Initiate high-intensity statin therapy
- Counsel on healthy lifestyle habits

Aged >75 y†
with conditions or drug-drug interactions influencing statin safety, or a history of statin intolerance
- Initiate moderate-intensity statin therapy
- Counsel on healthy lifestyle habits

Monitor statin therapy
(Figure 5)

*Fasting lipid panel preferred. In a nonfasting individual, a nonfasting non-HDL–C >220 mg/dL may indicate genetic hypercholesterolemia that requires further evaluation or a secondary etiology. If nonfasting triglycerides are >500 mg/dL, a fasting lipid panel is required. †It is reasonable to evaluate the potential for ASCVD benefits and for adverse effects, and to consider patient preferences, in initiating or continuing a moderate- or high-intensity statin, in individuals with ASCVD >75 years of age.
Primary Prevention

Initiating Statin Therapy

(Figure 2)
Counsel on healthy lifestyle habits

Diabetes and age 40-75 y†
OR
LDL–C ≥190 mg/dL

No diabetes, age 40-75 y, and LDL–C 70-189 mg/dL

*Fasting lipid panel preferred. In a nonfasting individual, a nonfasting non-HDL–C >220 mg/dL may indicate genetic hypercholesterolemia that requires further evaluation or a secondary etiology. If nonfasting triglycerides are >500 mg/dL, a fasting lipid panel is required.
Primary Prevention

Initiating Statin Therapy (con’t)

§ 1) Potential ASCVD risk reduction benefits (e.g., absolute risk reduction from moderate- or high-intensity statin therapy can be approximated by using the estimated 10-year ASCVD risk and the relative risk reduction of ~30% for moderate-intensity statin or ~45% for high-intensity statin therapy. 2) Potential adverse effects. The excess risk of diabetes is the main consideration in ~0.1 excess case per 100 individuals treated with a moderate-intensity statin for 1 year and ~0.3 excess cases per 100 individuals treated with a high-intensity statin treated patients for 1 year. Note: a case of diabetes is not considered equivalent to a fatal or nonfatal MI or stroke. Both statin-treated and placebo-treated participants experienced the same rate of muscle symptoms. The actual rate of statin-related muscle symptoms in the clinical population is unclear. Muscle symptoms attributed to statin should be evaluated in Table 8, Safety Rec 8.

‡These factors may include primary LDL–C ≥160 mg/dL or other evidence of genetic hyperlipidemias, family history of premature ASCVD with onset <55 years of age in a first degree male relative or <65 years of age in a first degree female relative, sensitivity-C-reactive protein ≥2 mg/L ≥300 Agatston units or ≥75 percentile for age, sex, and ethnicity (For additional information, see http://www.mesa-nhlbi.org/CACReference.aspx), ABI <0.9., or lifetime risk of ASCVD. Additional factors that may aid in individual risk assessment may be identified in the future.
Primary Prevention
Global Risk Assessment

• To estimate 10-year ASCVD* risk
  ▪ New Pooled Cohort Risk Equations
  ▪ White and black men and women
• More accurately identifies higher risk individuals for statin therapy
  ▪ Focuses statin therapy on those most likely to benefit
  ▪ You may wish to avoid initiating statin therapy in high-risk groups found not to benefit (higher grades of heart failure and hemodialysis)

* 10-year ASVD: Risk of first nonfatal myocardial infarction, coronary heart disease death, nonfatal or fatal stroke
Primary Prevention Statin Therapy

- Thresholds for initiating statin therapy derived from 3 exclusively primary prevention RCTs
- Before initiating statin therapy, clinicians and patients engage in a discussion of the potential for ASCVD risk reduction benefits, potential for adverse effects, drug-drug interactions, and patient preferences
Individuals Not in a Statin Benefit Group

- In those not clearly in 1 of 4 statin benefit groups, additional factors may inform treatment decision-making:
  - Family history of premature ASCVD
  - Elevated lifetime risk of ASCVD
  - LDL–C ≥160 mg/dL
  - hs-CRP ≥2.0 mg/L
  - Subclinical atherosclerosis
    - CAC score ≥300 or ABI<0.9

- Discussion of potential for ASCVD risk reduction benefit, potential for adverse effects, drug-drug interactions, and patient preferences
Safety

• RCTs & meta-analyses of RCTs used to identify important safety considerations
• Allow estimation of net benefit from statin therapy
  ○ ASCVD risk reduction versus adverse effects
• Expert guidance on management of statin-associated adverse effects, including muscle symptoms
• Advise use of additional information including pharmacists, manufacturers prescribing information, & drug information centers for complex cases
Statin Therapy: Monitoring Response and Adherence

*Fasting lipid panel preferred. In a nonfasting individual, a nonfasting non-HDL–C >220 mg/dL may indicate genetic hypercholesterolemia that requires further evaluation or a secondary etiology. If nonfasting triglycerides are >500 mg/dL, a fasting lipid panel is required.

†In those already on a statin, in whom baseline LDL–C is unknown, an LDL–C <100 mg/dL was observed in most individuals receiving high-intensity statin therapy in RCTs.

‡See guideline text
Reinforce continued adherence
Follow-up 3-12 mo

Yes

Anticipated therapeutic response?

Yes

Reinforce improved adherence
Increase statin intensity‡
OR
Consider addition of nonstatin drug therapy

Follow-up 4-12 wk & thereafter as indicated

No

Less-than-anticipated therapeutic response

Intolerance to recommended dose of statin therapy

Yes

Management of statin intolerance (Table 8, Rec 8)

No

Reinforce medication adherence
Reinforce adherence to intensive lifestyle changes
Exclude secondary causes of hypercholesterolemia (Table 6)

Follow-up 4-12 wk
Management of Muscle Symptoms on Statin Therapy

• It is reasonable to evaluate and treat muscle symptoms including pain, cramping, weakness, or fatigue in statin-treated patients according to the management algorithm

• To avoid unnecessary discontinuation of statins, obtain a history of prior or current muscle symptoms to establish a baseline before initiating statin therapy
Management of Muscle Symptoms on Statin Therapy (con’t)

If unexplained severe muscle symptoms or fatigue develop during statin therapy:
  • Promptly discontinue the statin
  • Address possibility of rhabdomyolysis with:
    ▪ CK
    ▪ Creatinine
    ▪ urine analysis for myoglobinuria
Management of Muscle Symptoms on Statin Therapy (con’t)

If mild-to-moderate muscle symptoms develop during statin therapy:

- Discontinue the statin until the symptoms are evaluated
- Evaluate the patient for other conditions* that might increase the risk for muscle symptoms
- If after 2 months without statin Rx, muscle symptoms or elevated CK levels do not resolve completely, consider other causes of muscle symptoms

*Hypothyroidism, reduced renal or hepatic function, rheumatologic disorders such as polymyalgia rheumatica, steroid myopathy, vitamin D deficiency or primary muscle diseases
Statin-Treated Individuals
Nonstatin Therapy Considerations

- Use the maximum tolerated intensity of statin
- Consider addition of a nonstatin cholesterol-lowering drug(s)
  - If a less-than-anticipated therapeutic response persists
  - Only if ASCVD risk-reduction benefits outweigh the potential for adverse effects in higher-risk persons:
    - Clinical ASCVD <75 years of age
    - Baseline LDL–C ≥190 mg/dL
    - Diabetes mellitus 40 to 75 years of age
- Nonstatin cholesterol-lowering drugs shown to reduce ASCVD events in RCTs are preferred
Lessons From the Vignettes

ASCVD risk calculation **NOT** needed:

• **Case 1: ASCVD**
  - High-intensity statin therapy for optimal risk reduction in those ≤75 years who tolerate it
  - Moderate intensity may be initiated or continued if >75 yo or if high-intensity Rx not safe or not tolerated

• **Case 2: LDL–C ≥190 mg/dL; 2°causes ruled out**
  - Evidence supports high-intensity statin therapy
  - LDL–C levels may still remain very high, even after the intensity of statin therapy has been achieved; addition of a nonstatin drug may be considered to further lower LDL–C
Lessons From the Vignettes

ASCVD risk calculator useful:

• Case 3: Diabetes; 40-75 yo; LDL–C 70-189 mg/dL
  - Moderate-intensity statin to be initiated or continued
  - High-intensity statin reasonable if estimated 10-year ASCVD risk calculated to be ≥7.5%

• Cases 4 & 5: Primary prevention; 40-75 yo; LDL–C 70-189 mg/dL
  - Use Pooled Cohort Equations (risk calculator) to estimate 10-year ASCVD risk for African American and white individuals to guide initiation of statin therapy
  - Clinician-patient discussion before treatment is initiated
  - Moderate or high intensity statin when ≥7.5% 10-year ASCVD risk
  - Moderate intensity statin therapy reasonable when ≥5% 10-year ASCVD risk or when other characteristics that increase ASCVD risk are present
Lessons From the Vignettes: Primary prevention - Not in statin benefit group

- In selected individuals with LDL–C <190 mg/dL who are considered for primary prevention therapies:
  - Not otherwise identified in a statin benefit group
  OR
  - After quantitative risk assessment, a risk-based treatment decision is uncertain

- Moderate intensity statin therapy reasonable when 5 to <7.5% 10-yr ASCVD risk

- Additional factors that increase risk may be considered
  - LDL ≥160 mg/dl, Family history of premature ASCVD, Lifetime risk of ASCVD, hs-CRP ≥2.0 mg/L, CAC score ≥300, or ABI ≤0.90
Lessons From the Vignettes: Primary prevention - Not in statin benefit group

• In selected individuals with LDL–C <190 mg/dL who are considered for primary prevention statin therapy:
  
  - *Statin therapy may be considered* after evaluating the potential for ASCVD risk reduction benefits, adverse effects, drug-drug interactions, and discussion of patient preferences
  
  - Example of where guidelines inform clinical judgment but do not replace it
JR15  deleted repetitious wording
        Jennifer G Robinson, 11/27/2013

JR16  there is not vignette for this example to confusing. changed header to reflect content
        Jennifer G Robinson, 11/27/2013
Three Principles

• Do not focus on LDL-C or non-HDL-C levels as treatment goals
  – Although continue to use LDL-C to monitor adherence

• Use medications proven to reduce ASCVD risk

• Drug treatment decisions in primary prevention based on *What Will Most Benefit the Patient*
  – Clinician-patient discussion needed in primary prevention
Future Updates to the Blood Cholesterol Guideline

• This is a comprehensive guideline for the evidence-based treatment of blood cholesterol to reduce ASCVD risk
• These guidelines represent a change from previous guidelines
• For primary prevention, they are “patient-centered”
• Guidelines will change in the future as high-quality data will improve future cholesterol treatment guidelines
